

AKEIM JOSEPH

AI-Native Product Engineer — Agent Orchestration & Applied Systems

(325) 733-8767 | akeimjoseph4@gmail.com | linkedin.com/in/akeim-joseph-994963276 | github.com/fastpackcyclist-lgtm | Augusta, GA (Open to relocation)

PROFESSIONAL SUMMARY

Solo builder who designs, directs, and verifies AI-built systems rather than prompting them into existence. A.R.C.H.O.N. is a multi-agent orchestration system built around a biomimetic safety architecture — bounded, non-agentic narrow processes (“Nano-AI”) coordinated by a supervising agent, hard permission gates on every state-changing action, and a deterministic evaluation harness (built and validated this month) that grades agent-loop behavior against fixed test cases plus an LLM-judged quality score. SFT Command was a financial intelligence platform with 200+ backend services and live fintech integrations (Plaid, Stripe, Yahoo Finance); after 8 months of self-funded outreach to fiduciary buyers produced zero pilots, I made the call to wind it down rather than keep building past a market that wasn't there. That failure taught me something specific about my own shape as a builder: I'm technical, not a salesman, and I now know which of those two skills is actually mine. Nine years of direct customer-facing work — sales, service, high-throughput quality control — shapes how I scope and deliver technical systems: discovery first, architecture second, implementation directed and verified, not guessed at.

TECHNICAL SKILLS

AI & Agent Systems: AI coding agent orchestration (Claude Code, Cursor, Base44), multi-model LLM routing (OpenAI GPT, Google Gemini, Anthropic Claude), autonomous agent loops with bounded iteration limits, non-agentic narrow-task orchestration (“Nano-AI”) for crash-safe autonomous systems, deterministic evaluation harnesses (fixed-case assertions + LLM-judged scoring), RAG pipelines with confidence-weighted retrieval, multi-agent task delegation with human-approval gating, voice AI (TTS/STT, real-time voice proxy)

Languages: JavaScript (ES6+) and TypeScript — primary languages across both shipped platforms (SFT Command: 86.1% JS / 13.4% TS; A.R.C.H.O.N.: 99.5% JS; PRISM: 93.5% JS/JSX); SQL (Postgres/Supabase schema and migrations)

Backend Engineering: REST API design, microservices architecture (200+ deployed functions), webhook handling, event-driven systems, rate limiting, circuit breakers, audit logging, multi-tenant data isolation, role-based access control (RBAC), compliance ledger with hash-chain sealing

Database & Data Modeling: 80+ entity schemas across two platforms, JSON schema design, multi-tenant architecture, compliance audit trails, append-only immutable memory systems, content hashing

Financial Technology: Plaid (account linking, balance sync, transaction mapping, brokerage sync), Stripe (payments, subscriptions, identity verification), real-time market data (Yahoo Finance API v8), trading signal generation, Monte Carlo simulations, net worth projection, cash flow forecasting

Frontend Engineering: React provider hierarchies, lazy-loaded module registries, canvas-based blueprint and visualization systems, real-time data visualization (2D vector + 3D wireframe), motion-budget animation systems

DevOps & Infrastructure: CI/CD pipelines, automated testing, system health monitoring, production readiness dashboards, credit/cost budget management for AI operations

Platform Integrations: Plaid, Stripe, Yahoo Finance, NewsAPI, OpenAI, Google Gemini, Anthropic Claude, Twilio (SMS), Supabase, email automation

PROFESSIONAL EXPERIENCE

Creator & AI Product Engineer — A.R.C.H.O.N. (Independent R&D)

August 2025 – Present | Augusta, GA

A multi-agent orchestration system: a supervising agent coordinates bounded, single-function “Nano-AI” processes under hard safety limits.

- **Nano-AI Safety Architecture:** Designed a biomimetic orchestration model — a supervising agent delegates bounded, single-function, non-agentic narrow processes that each perform one deterministic task and connect only to explicitly wired data sources. Identified an unbounded-orchestration failure mode empirically (2 system crashes from unconstrained recursive/concurrent agent loops) and designed rate limits, circuit breakers, and hard iteration caps that eliminated further crashes.
- **Evaluation Harness:** Built a deterministic evaluation harness that grades agent-loop directives against fixed test cases — deterministic assertions plus an LLM-judged quality score — because an AI-directed system has to prove its agent actually works, not just assume it. Two months in development; first passing validation run completed this month.
- **Observability & Permission Gating:** Built a live diagnostic panel exposing real-time node state and inter-agent messages, paired with a hard permission gate requiring explicit human sign-off before any autonomous code-writing or state-changing action — no consequential action executes without visibility and approval.
- **Autonomous Agent Orchestration:** Built an autonomous AI reasoning loop on a 75-second cycle — the system generates its own analysis tasks, journals results, and runs metacognition checks every 4th cycle. Designed tiered cognition routing (automatic model-tier selection by task load) and credit budgeting to cap spend.
- **Memory & Knowledge Architecture:** Designed a multi-layer memory system — working buffer (short-term, 6-item ring), persistent memory (long-term, topic-clustered, confidence-weighted RAG), and immutable historical memory (append-only). Deterministic, arithmetic-only analytics throughout — every chart derives from actual records, never estimation.
- **Security Architecture:** Specified a 5-layer defense model (edge, gateway, application, database, core) with threat tracking, multi-code access verification, clearance levels, and authenticated encryption (AES-GCM-256) for node-to-node communication.

(Private repository — code available for review upon request)

Founder — SFT Command LLC (financial platform for independent RIAs)

Building since August 2025 · LLC registered January 2026 | Augusta, GA (winding down)

- Built a 200+ backend-function platform with live Plaid (account linking, balance sync), Stripe (payments, subscriptions, identity verification), and Yahoo Finance integrations — 50+ database schemas, multi-tenant isolation, RBAC, compliance audit trails.
- Architected five domain-scoped AI agents coordinated into a single compiled answer, plus predictive analytics (5-year net worth projection, cash flow forecasting, Monte Carlo simulation).
- Eight months of direct outreach to fiduciary buyers produced zero pilots — a distribution and trust-network problem, not a technical one. Made the call to wind the entity down rather than keep funding a sales motion I'm not suited for; code retained as capability evidence.

CUSTOMER-FACING & OPERATIONS EXPERIENCE

Nine years of direct customer discovery, technical product matching, and high-throughput quality control — the same discovery-first discipline now applied to scoping AI systems.

Customer Service — AutoZone

March 2024 – July 2024 | Louisville, KY

Diagnosed customer vehicle issues against part specifications to recommend the correct fix, not just the requested part — managed sales and returns via POS with 100% daily cash-drawer accuracy, and supported inventory cycle counts.

Busser / Server Assistant — Vincenzo's

2023 | Louisville, KY

Customer service in a five-star dining environment — sustained attention to detail and service standards under a high-scrutiny, low-margin-for-error customer base.

Sales Associate — Middle of Town Cycling

August 2023 | Louisville, KY

Matched customers to bikes and gear based on riding style, body fit, and technical requirements — direct precursor to translating a customer's stated need into the right technical solution.

Delivery Driver — Jimmy John's

January 2023 – May 2023 | Louisville, KY

Optimized daily delivery routes for 40–50 scheduled stops, ensuring 98% on-time delivery. Maintained detailed daily logs and documentation for shipments.

Line Associate — Smithfield Packaging

2020 | NC

Ran quality control and product-separation on a pork-plant delivery line — sustained focus and pace-setting attention to detail preventing cross-product contamination across outbound pallets. Frequently staffed the line solo after teammates unable to sustain the required pace were let go.

Busser / Dishwasher — Cracker Barrel

2019

Restaurant support role — food safety, cleanliness standards, and sustained pace during high-volume service.

Additional prior roles: Lytle Land & Cattle (2018, Abilene, TX), Cardinal Moving (2024), Eggs Up Grill (2025, Augusta, GA) — available on request.

EDUCATION

Southern New Hampshire University (SNHU) — Online

Associate of Science, Accounting — Expected Spring 2027

Relevant coursework: Financial Accounting, Managerial Accounting, Applied Statistics, Foundations of Written Communication

Abilene High School — Abilene, TX

High School Diploma with Criminal Justice Endorsement | Track and Field athlete

ABOUT

I work in English, not syntax. I design systems in natural language, direct AI coding agents for implementation, and review, debug, and ship the output. I've built 200+ backend functions, 80+ database schemas, and 20+ application pages — solo, across two platforms. Nine years of direct customer-facing work taught me to lead with discovery before solution; winding down my own company taught me the difference between a technical skill and a sales one. I'm looking for a forward-deployed, customer-facing technical role where that combination — real discovery skill plus AI-directed engineering velocity — sits inside a customer's actual environment and ships something they needed, not something I assumed they needed.
